

Rows 2 and 3 are the same contract.

Setting an inner transaction's fee to zero does not make it free. It moves the cost onto the caller, because fees pool across the whole group — any surplus on one transaction covers a shortfall on another.

Row 4 is what happens when you forget.

The contract covers its own inners out of its own account, so every call drains it a little, and the day the balance touches its minimum every call starts failing — for a reason nothing in the code points at.

Fees pool across the whole group. The 700-opcode budget pools only across the app calls in it.
