

reward_per_token, accumulated

The pool pays 1 token per round, split among whoever is staked at that moment.

rounds 1,000–3,000: only Alice is in, so rpt climbs $2,000 \div 100 = 20$. Then 400 are staked, so the same 2,000 tokens move it only $2,000 \div 400 = 5$ further. rpt ends at 25.

Alice: $100 \times (25 - 0) = 2,500$. Bob: $300 \times (25 - 20) = 1,500$. Total 4,000 — every round paid once.
